

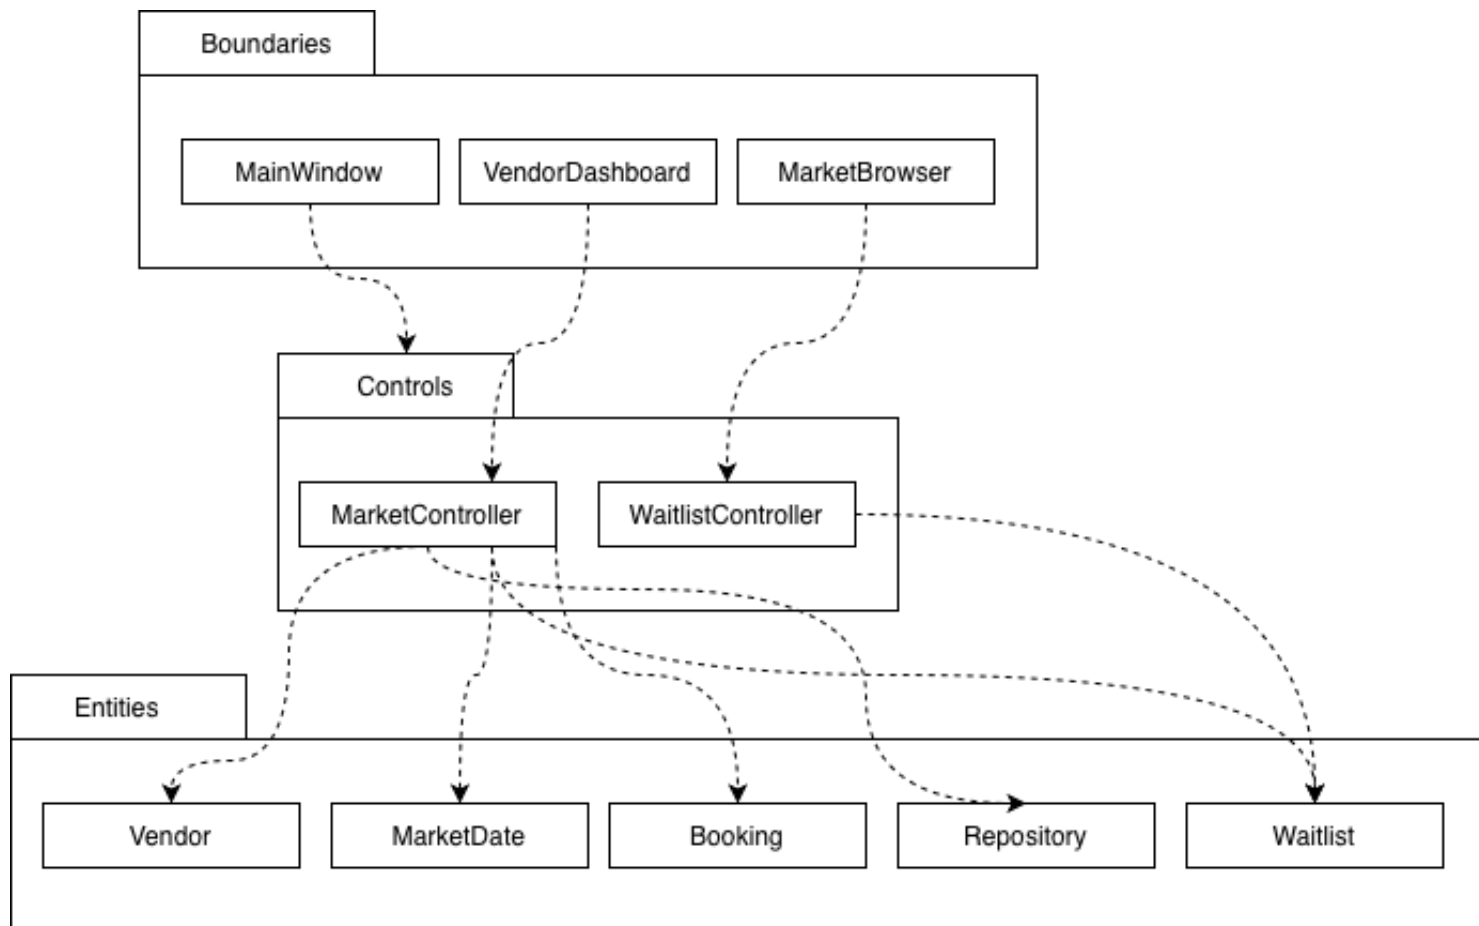

Figure 1: HintonMarket System Decomposition Showing Subsystem Organization and Dependencies

This subsystem decomposition minimizes coupling by having three distinct layers which only interact with the layer beneath them. Boundaries communicate exclusively with the control classes and never directly access the entities. This diagram maximizes cohesion by grouping related responsibilities of the classes.

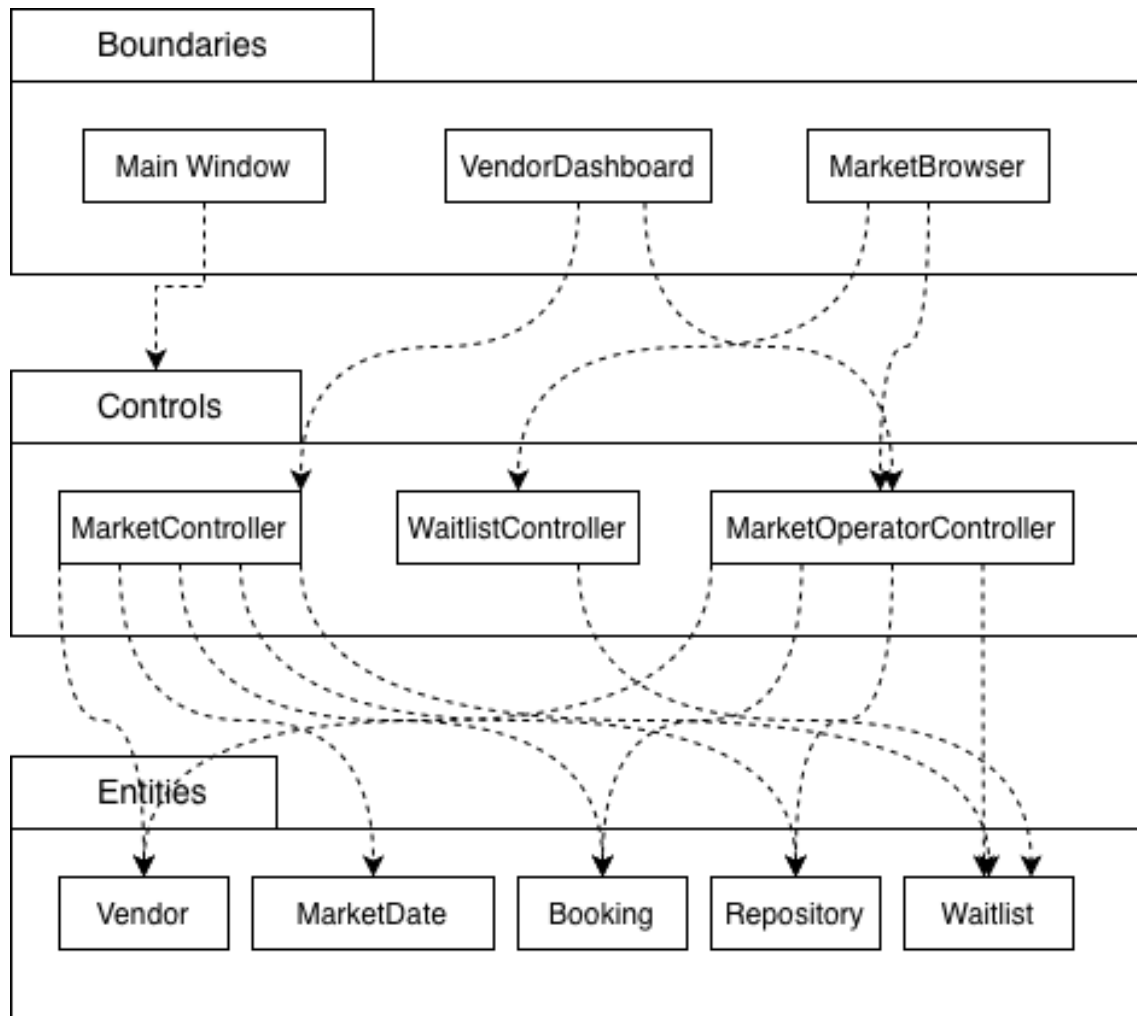

Figure 2: HintonMarket System Updated Decomposition Showing Subsystem Organization and Dependencies

The updated HintonMarket System include a new class, “MarketOperatorController”, which allows the Market Operator to manage vendor bookings and waitlist positions. The change was the addition of administrative abilities. The updated version still supports cohesion as it groups related classes.
